

Controlling your device

Pulse by Carnetics allows you to take advantage of the advances in technology afforded by GPRS. This allows a constant flow of data to your personal web page showing vehicle location, speeds, and activity such as start and stop times of journeys. Due to the sophisticated protection at our secure website you can use any computer in the world to access your data with no need to download maps.

What is GPRS?

GPRS is the communication carrier on the GSM network that allows high volumes of data to be transmitted when required through a connection using the mobile network. It does not connect like a phone call, instead making a connection for as long as there is data to be transmitted.

Download Charges

As Pulse uses the GPRS network you will never download data, it will automatically be sent and available on the site for you to run reports. At any moment the vehicle is in use, a report will be sent updating its position and storing the information on your password protected pages. As the data is flowing all the time, you are only charged a standard monthly amount to cover this cost.

Location And Professional Installation

The location of the device within the vehicle is important to ensure good visibility to the satellites while not compromising the covert installation. A professional installation by our skilled engineers will ensure the device is correctly located and fully commissioned. Installation is available at any location in the UK and Northern Ireland. Our engineers can work at remote locations and will usually complete the installation in less than one hour including a commissioning test.

Contract Options

You can choose the length of your monthly contract to suit your needs. As you would expect, the longer your commitment, the less you pay. We have contracts of one month or two years. Talk to our customer services team about what is best for you.
